

Axis:

- **Specie to Face Value Ratio:** The specie value was divided by the face value to calculate a ratio between 0 and 1 for each certificate
- **Date:** The date on which each certificate was issued

Each certificate was then plotted as a point on the graphs below

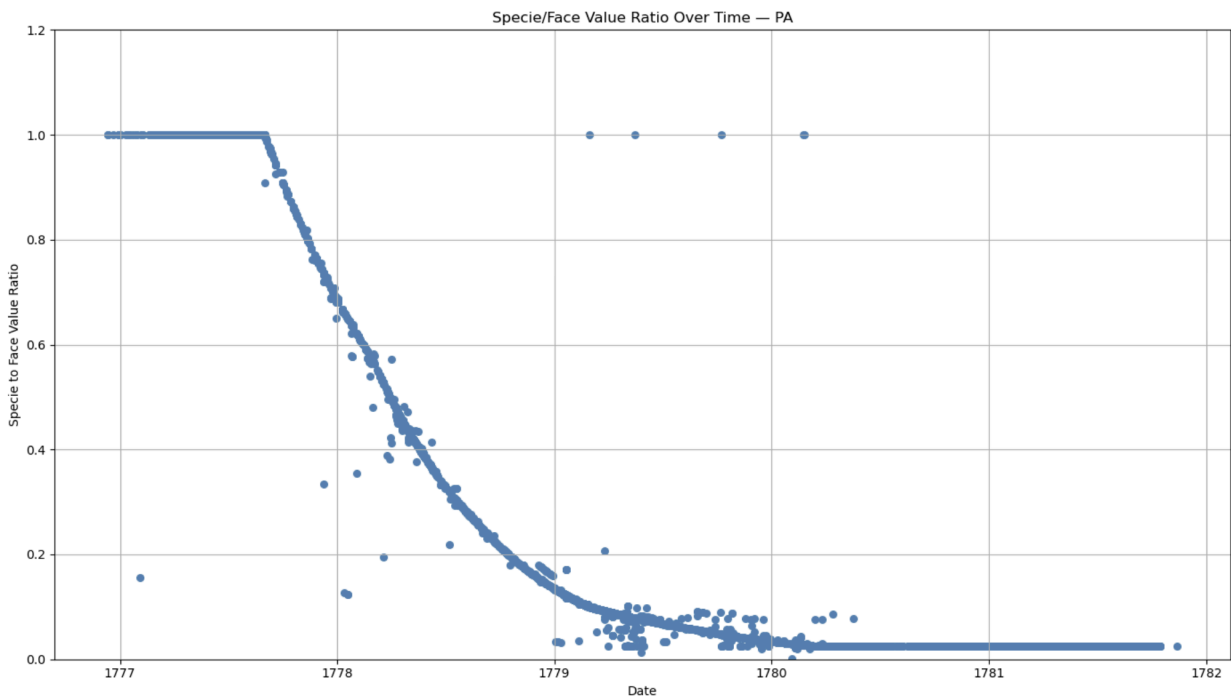

Complete Graph

Graph of every certificate that was issued.

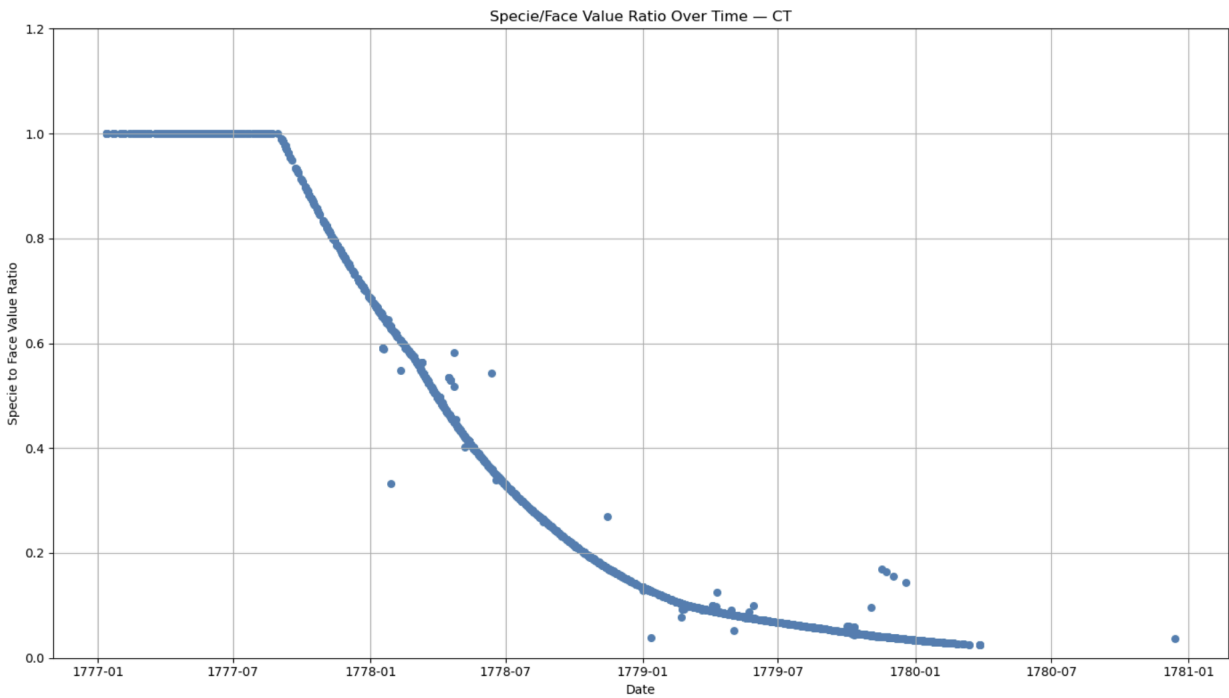

Considerable number of outliers, but difficult to distinguish by state (see next)

Philadelphia

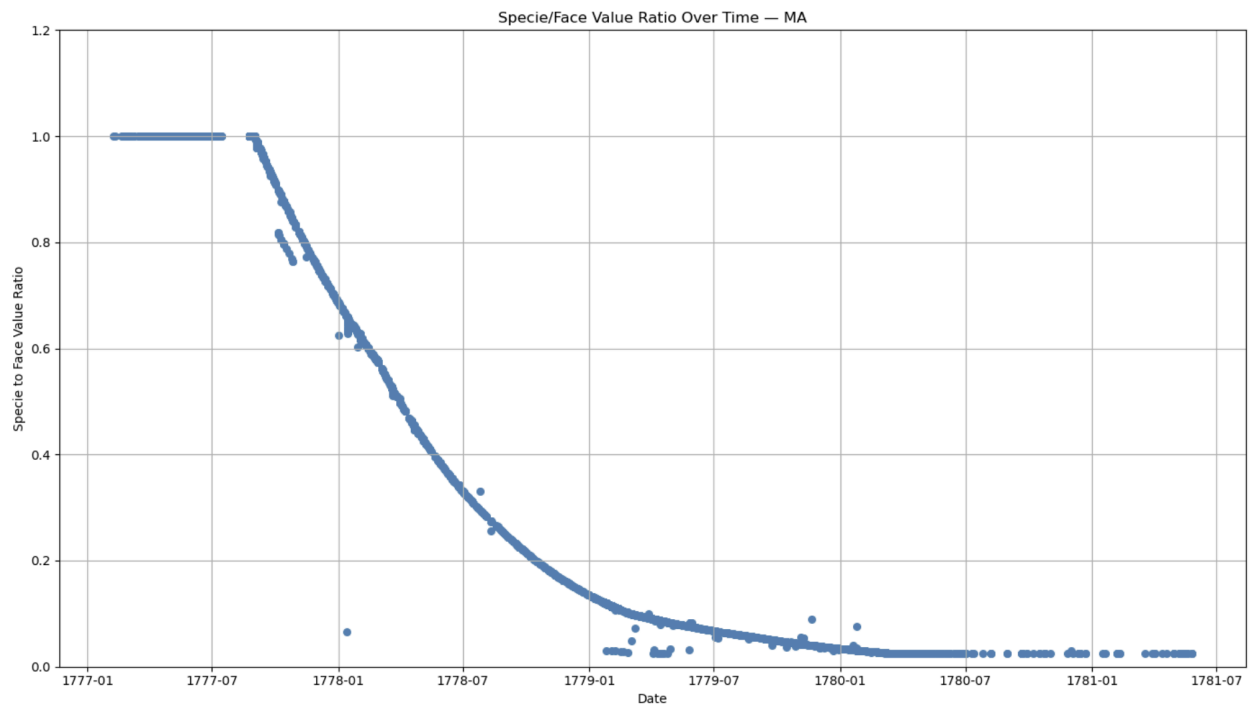

Many certificates were given at ratios similar to the standard depreciation, even if they deviated by a bit. Some were considerably lower, with a notable few being at a 1:1 ratio. Maybe typos or errors.

Connecticut

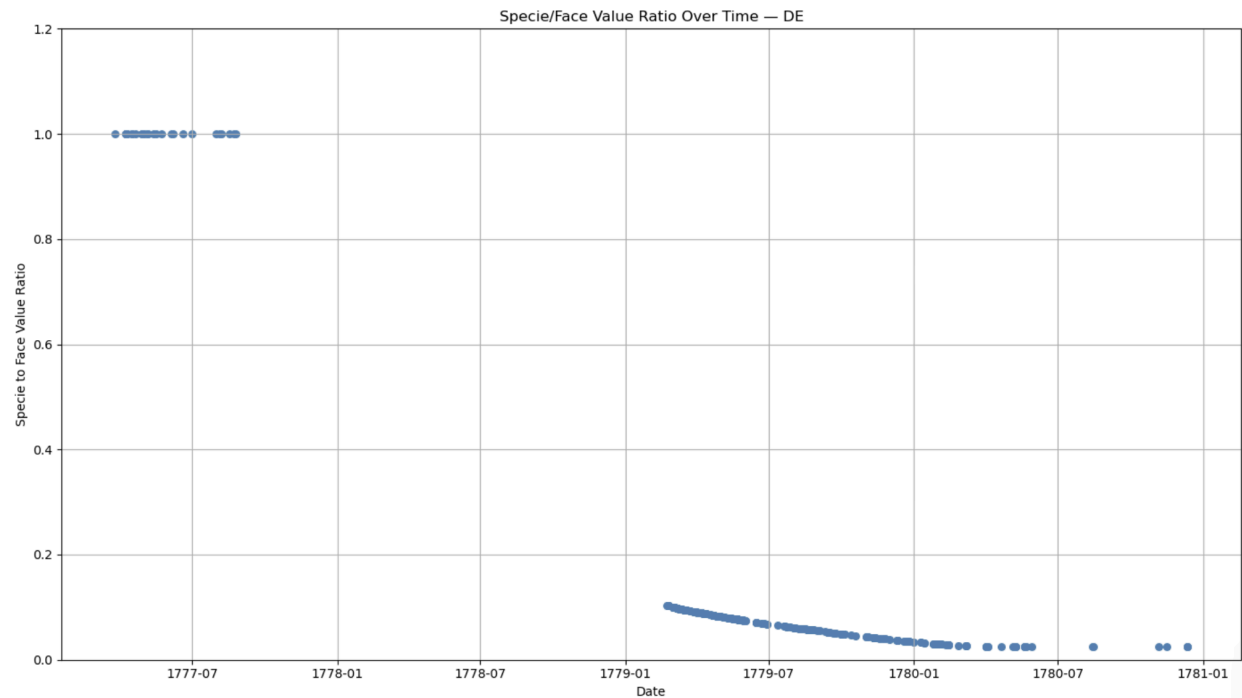

Similar to Pennsylvania, with a few deviations, but generally close to the curve.

Massachusetts

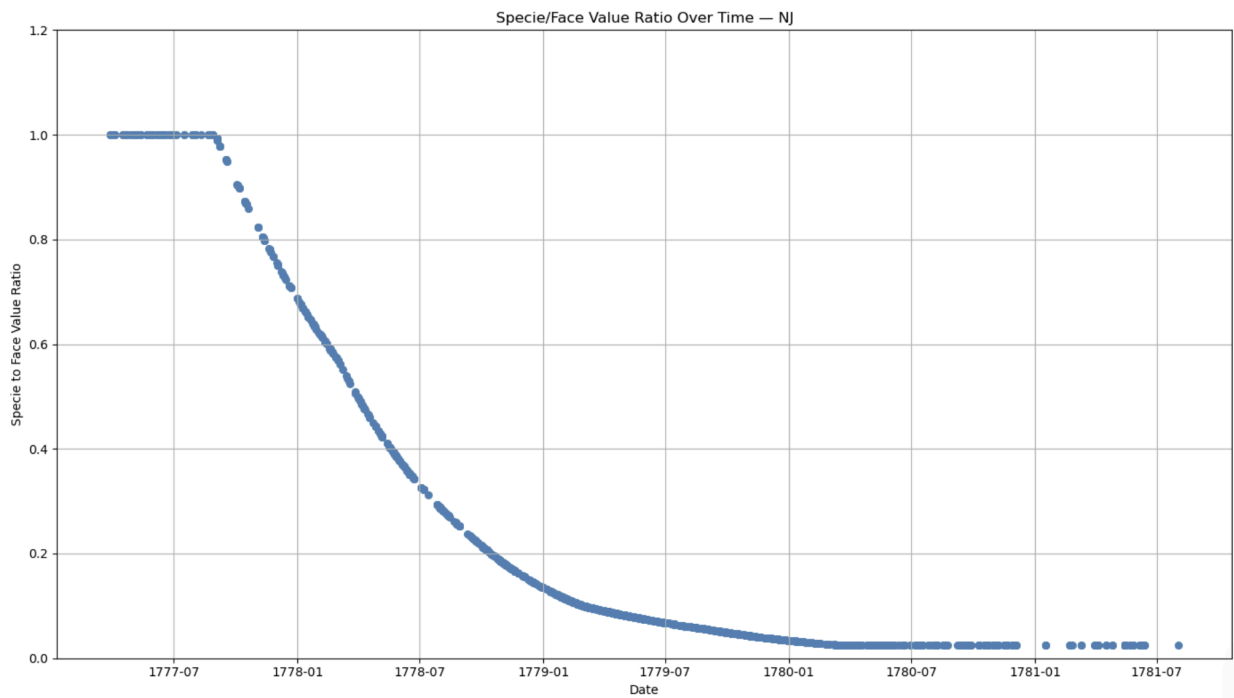

Few minor deviations from the curve. Notable clusters below the curve around late 1777 and early 1779, which may indicate some intentional behavior

Deleware

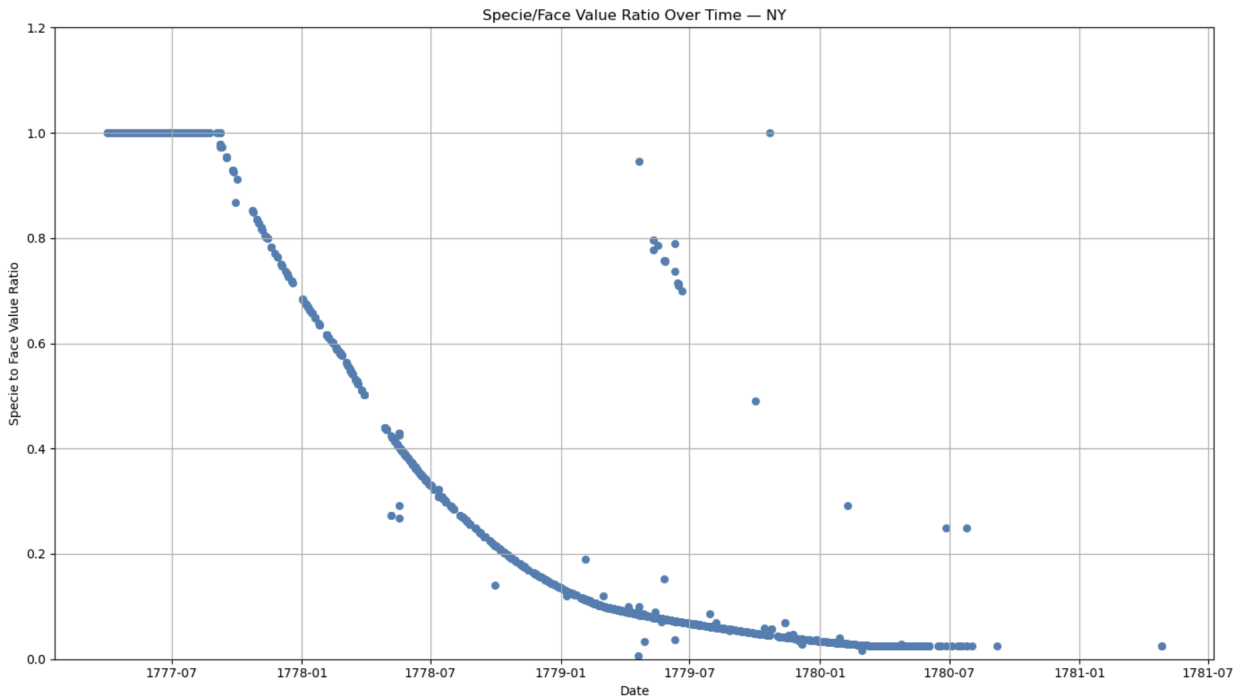

Follows the regular curve. Big gap between late 1777 and early 1779.

New Jersey

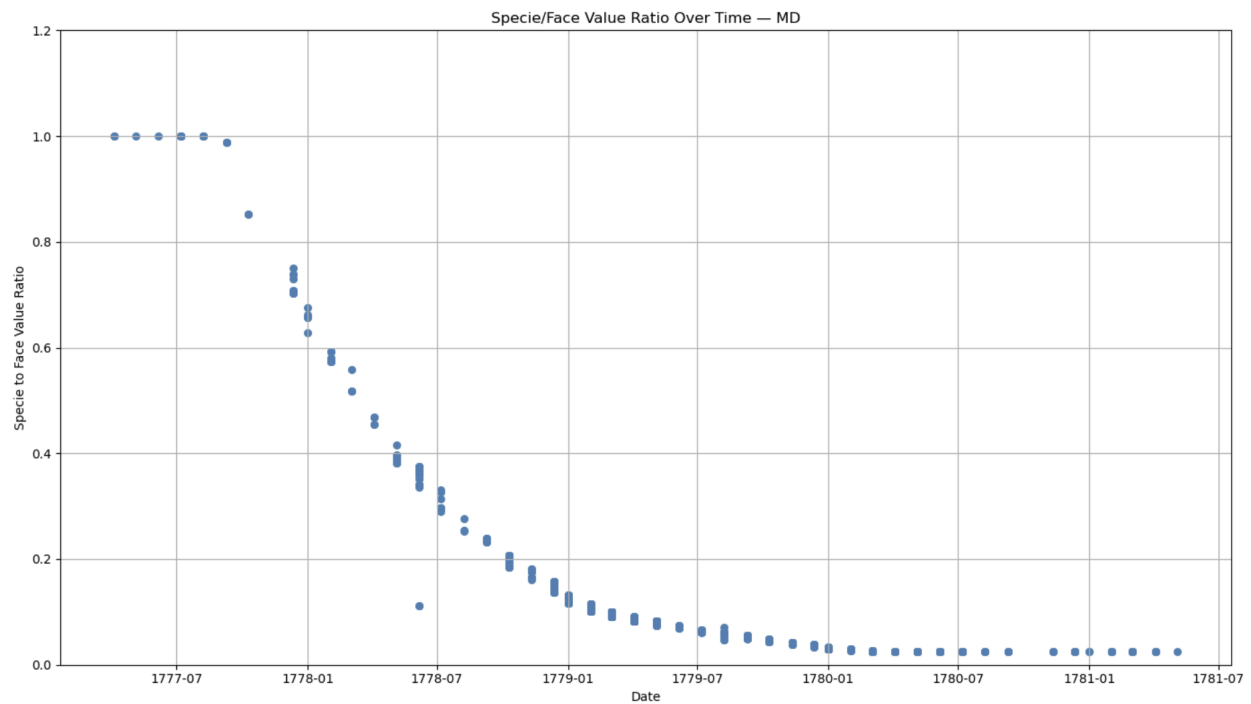

Follows the regular curve.

New York

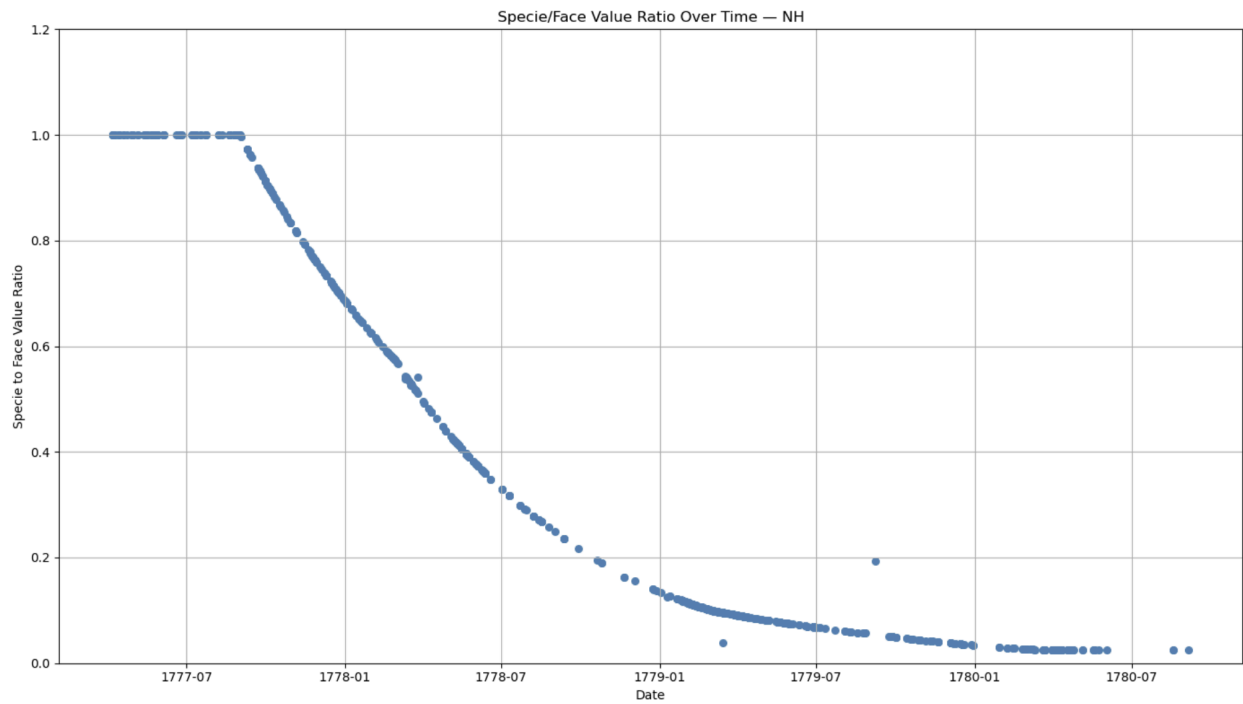

Minor deviations around the curve. Occasional major outliers above the curve. Interesting cluster around mid-1779, well above the regular curve. Might indicate some intentional behavior. Another curve could be possible with the points above the regular curve.

Maryland

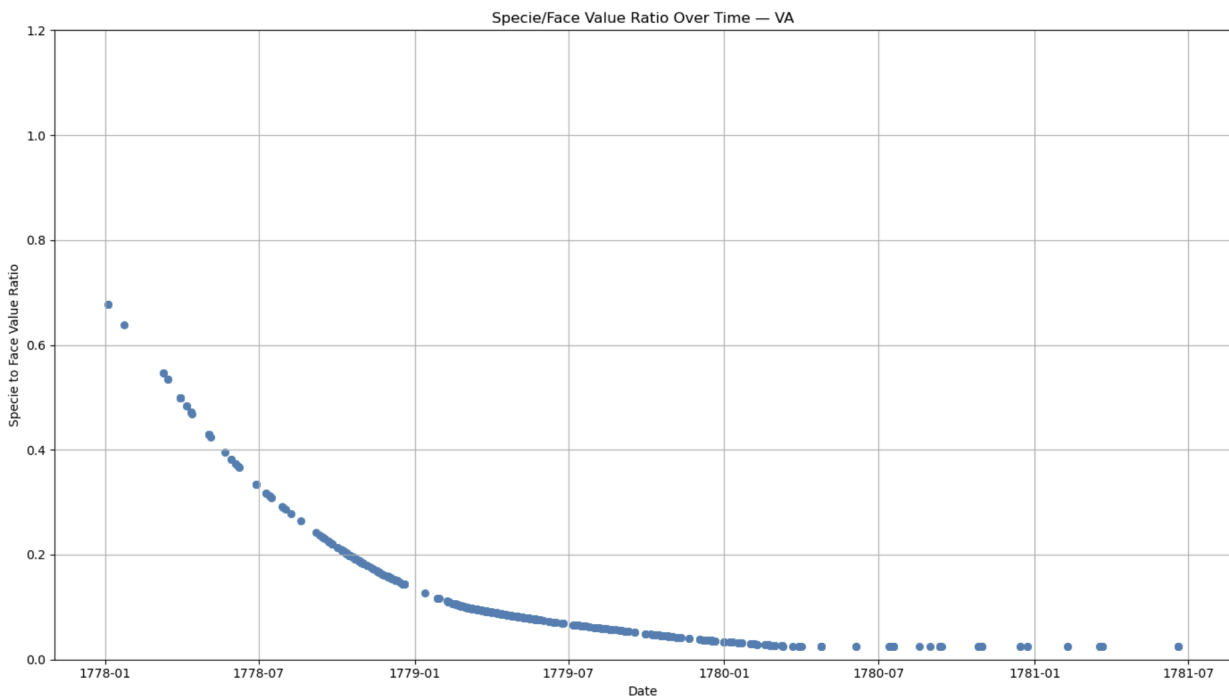

Interesting pattern of many different specie to face value ratios for certificates issued on the same day, though still generally follows the curve. One outlier is likely a typo. Certificates are also issued on specific and less frequent days, which may be worth investigating.

New Hampshire

Follows the curve. Few outliers that are likely typos.

Vermont

Follows the curve (x-axis was changed).
